

SecureSuite Quick-Start Guide

That's it! You have completed the installation of *SecureSuite*. You can now logon using the password you selected at the start of the setup process, or with a touch of a finger on the AuthenTec sensor module.

The features of *SecureSuite* are detailed starting with Chapter 3 in the User's Manual supplied on the distribution CD-ROM disc, or in on-line Help.

SecureSuite Quick-Start Guide 2093 Rev 1.1a (28NOV00)

AuthenTec, Inc.
Personal Security for the Real World™

SecureSuite
Access Control Software
for use with the

AuthenTec Sensor Kit and Windows 98®

Are you using Microsoft® Windows® 98? Now that you have successfully installed the AuthenTec software and the *Aware* demonstration application, you can also try out a collection of sophisticated access management tools called SecureSuite™.

This 30-day demonstration package from I/O Software, Inc. will help you better understand the powerful advantages of identification, authentication, access control, and asset management using the most trusted of human biometric measurements: the individual's fingerprint.

In this guide, **bold blue text** indicates screen and dialog box titles and similar pointers, while **bold black text** indicates available selections or choices.

**Make sure the fingerprint sensor module is attached,
and let's get started!...**

1 Start the Installation...

Insert the AuthenTec distribution CD-ROM disc into its drive and select **Browse this Compact Disc** from the Main Menu after auto-start. The directory of the disc appears. From the listed files, select

SecureSuite_EVAL[ver].exe

The installation program begins, and a series of dialog boxes appear in sequence:

- ◆ **Welcome to the SecureSuite Setup Program** – Read this message, then click **Next** to continue, or **Cancel** to exit.
- ◆ **Software License Agreement** - If you choose **No**, Setup will close. Click **Yes** to accept the license and install the program.
- ◆ **User Information** - Type your name and organization in the text fields. Click **Next** to proceed, or **Cancel** to exit.
- ◆ **Choose Destination Location** - Choose where you want the application files to be installed. Click **Next** when you're ready.
- ◆ **Select Components** – Select or clear to specify the components you want. Click **Cancel** to exit **Setup**, or **Next** to install files.
- ◆ **Warning** - Click **OK** to acknowledge that this is an evaluation version.
- ◆ **Information** - Click **OK** to reboot.

2 Use the Configuration Wizard...

This facility appears when the computer restarts. Use it to configure *SecureSuite* to work with your computer. You can establish a Master Password, which provides a way to override security and access your computer in the event of hardware failure. On the **Welcome** screen, click **Next** to proceed.

The **Setting the SecureSuite Master Password** dialog box appears. Select **Enter a new Master Password**, then click **Next** - the **Entering your new Master Password** dialog box appears. Type a password into the top field, then confirm it in the field below. Click **Next** to proceed. The **Creating the SecureSuite Master Access Disk** dialog box appears – select **No, do not create Master Access Disk**, then click **Next**.

3 Set up the Administrator Account...

The **Setting up your first administrator account** dialog box appears. *SecureSuite* uses a special account to manage system settings. This account is used to add new users, modify existing accounts, set logon options, and designate additional Administrators.

Select **Create a new account for the administrator**. Click **Next**. The **Administrator Information** dialog box appears.

In the text fields provided, type your User Name (a nickname, or perhaps your first name) and your full name. Click **Next** - the **Password Assignment** dialog box appears. Type a password into the top field, then confirm it in the field below. Use the same password that you used at the beginning of *Setup*, or provide a different password. Click **Next** to proceed.

The **Authentication Method Selection** dialog box appears. The **AND** and **OR** radio buttons at the bottom of the box determine how the Administrator's identity is to be verified for logon. Select **AND** for both password and fingerprint authentication. Select **OR** to require either a password or a fingerprint (this is the default). Click **Next**. The **Select a Finger to Enroll** dialog box appears. Select a finger for enrollment by clicking on the fingertip, then click **Next**.

The **Scanning Your Fingerprints** dialog box appears. Follow the prompts until scanning is complete. A **Green** outline indicates a good scan. Rescan any fingerprint that shows a **Yellow** or **Red** outline. Click **Finish** to complete the installation.
